Evidence Collection Protocol

1. Documentation analysis

Note: Evidence to be collected by NotebookLM, output to be manually verified by the researcher

Sources to review

- product/education webpages and marketing claims
- privacy policy
- terms of service/use
- child/student-specific privacy or safety documentation where available
- responsible-AI/safety documentation
- accessibility information
- help/support documentation relevant to the criteria
- technical, security or governance documentation where publicly available

NotebookLM prompt

Using the supplied sources for [TOOL] and the audit framework, collect documentary evidence for all criteria where Documentation (D) is an identified evidence source. Return evidence in the columns used by the Evidence Log sheet from audit_workbook_template.

For each evidence item, provide the source, a faithful relevant extract, and a concise factual explanation of how it relates to the audit question. Record meaningful contradictions or caveats in Notes. Where no relevant documentary evidence can be located for a criterion, state this in Notes. Where another evidence source (W or B) is required to assess an aspect of the criterion, this may also be noted briefly. Create evidence IDs as well, e.g. TOOL_D_CR1.1, TOOL_D_CR1.2.

Do not create a separate "Gaps" analysis, speculate about undocumented internal processes unless the criterion specifically requires that evidence, assign audit ratings, or use evaluative language about how well the tool performs.

* References the documents supplied to NotebookLM in Google Docs/Sheets format for evidence extraction purposes

What to record

- As per columns specified in the Evidence Log

Evidence rules

- prioritise first-party provider documentation
- record both positive and negative evidence
- if information cannot be found, do not infer it

- internal processes that cannot be externally verified remain Not evidenced under the rules already established in the audit framework
- marketing claims should be recorded separately from evidence demonstrating that the claim is actually implemented

2. Product walkthrough

Walkthrough sequence

A. *Access and onboarding*

Check:

- account creation requirements
- available user roles
- age/date-of-birth questions
- school/institution requirements
- relevant consent or parental/teacher controls
- introductory claims or warnings

B. *Privacy and defaults*

Check:

- default privacy choices
- data-sharing/training options visible to the user
- whether settings can be changed
- history/storage settings
- deletion controls

C. *AI transparency*

Check:

- whether AI involvement is clearly disclosed
- explanations of capabilities/limitations
- warnings about accuracy
- information about appropriate/inappropriate uses

D. *Available GenAI functionality*

Check:

- what GenAI functionality is actually available
- whether functionality differs by teacher/student role
- what kinds of inputs and outputs are supported

E. *Human oversight and control*

Check whether the teacher/user can:

- review outputs
- edit or reject them
- regenerate them

- stop/disable relevant functionality
- supervise child-facing interactions where applicable

F. Reporting, correction and remedy

Check:

- reporting mechanisms
- feedback mechanisms
- complaints/support
- correction of information
- deletion of data/history/accounts
- escalation routes

Evidence capture

3. Structured behavioural testing

Only conduct a behavioural test where:

- the audit framework identifies behavioural evidence as relevant
- the criterion cannot adequately be assessed through documentation/walkthrough alone
- the behaviour can be assessed against a reasonably objective predefined standard

Behavioural-testing rules

Where testing is necessary:

- derive the test from the specific audit criterion
- use synthetic information only
- do not enter real student data
- use a fresh interaction/session where possible
- preserve the exact prompt/input
- preserve the full raw output
- record date, account type and relevant settings
- repeat only where necessary to establish whether an observed behaviour is consistent rather than a one-off
- assess only the behaviour the test was designed to examine

Each behavioural test condition will be conducted twice in independent fresh sessions under otherwise equivalent conditions. If the two runs produce materially conflicting findings relevant to the audit criterion, a third run will then be conducted to clarify whether the observed behaviour was repeatable.

Where a planned behavioural test cannot be completed because the relevant functionality is inaccessible or produces a technical error, the failure will be recorded and one reasonable retry may be made in a fresh interaction. If the functionality remains unavailable, a non-equivalent function will not be substituted solely to obtain a result. The criterion will instead

be assessed using the remaining applicable evidence sources, with the behavioural evidence recorded as unavailable/not assessable where appropriate.

4. Evidence-source priority rule

Situation	**Method**
Criterion concerns what the provider states or documents	Documentation
Criterion concerns a visible setting, control, disclosure or interface behaviour	Walkthrough
Criterion concerns how the GenAI actually responds or behaves	Behavioural testing
Documentation/walkthrough already provide sufficient evidence	Do not test behaviour unnecessarily
Required evidence concerns inaccessible internal processes	Not evidenced

Note: Where documentary claims conflict with observable product behaviour, both sources will be retained. The discrepancy will be recorded explicitly and taken into account when applying the rating rules defined in the audit framework.
